

Power Quality Services

“Power Quality, Availability and Reliability can make the difference between corporate profit and loss. In certain situations, it can literally be a matter of life or death,”

The best systems match power needs, system performance and connected load demands to meet safety, economic and performance requirements.

Electrical components and the human element both play a role in system availability and reliability or up-time.

Additions or changes that incorporate new equipment in your facility, can impact uptime drastically.

We help you to define the economics associated with your facility and operations to provide solutions that will improve your return on investment.

Our motivated, success-oriented approach is the same whether we are optimizing a regional data center for a Fortune 500 company, helping assure that a new piece of equipment going into an existing facility will operate properly or troubleshooting an existing problem.

APS offers a comprehensive range of Power Quality and Reliability Services to a wide range of operations and industries including data centers, call centers, medical centers, processing, manufacturing, telecommunications, government, military and utilities.

Our services include:

- System Feasibility Studies, Needs Assessment & ROI Analysis
- Power Quality Testing, Troubleshooting and Analysis
- Power Quality and Power System Reliability Review and Consultation
- Electrical System Commissioning/
- Equipment Testing Plans & Services
- Lightning Protection
- Technical Project Management
- Development of RFP/RFQ documents & Performance Specs
- Failure Analysis
- Load Surveys & Harmonic Studies
- Environmental and Electromagnetic
- Interference Testing
- Power Quality & Safety Training Classes
- Electrical System Conceptual Design Consultation, Review and Specification Development.

Contact us today to discuss a game plan tailored to your facility.
